

1.2. Purpose of JavaScript:

- JavaScript's primary purpose is to enable client-side scripting on web pages. This means it allows developers to manipulate the content and behavior of web pages directly within the user's web browser.
- With JavaScript, we can dynamically update web page elements, validate form inputs, and respond to user interactions like clicks, mouse movements, and keyboard input.
- Additionally, JavaScript can interact with web servers through AJAX (Asynchronous JavaScript and XML) to fetch data without requiring a page reload.

1.3. Setting up the development environment:

To start coding in JavaScript, we need a development environment set up.

Here are the basic steps:

A Better way to take searchable notes

I needed to have a better way to retrieve useful information from my handwritten scrums. A way that I could sit in a meeting, writing naturally with pen and paper, but at the same time be able to later use the information I had recorded.

In other words, my notes needed to be:

- handwritten
- in my normal handwriting
- searchable
- clear and concise for future recall.

I'd seen the Rocketbook note system before. A notebook (or printable templates) that could be scanned using a clever app and saved to email or cloud services like Dropbox. It was pretty clever. The app could also apply OCR to convert these scans into basic text files. Not bad, but not brilliant either. Formatting was a bit hit and miss, so required a fair amount of manual correction for typos, odd punctuation and clarity.

The solution to build?

A tool I've used a few times before - Claude AI. I uploaded the .txt file and asked Claude to

Basics

Cycle:

When a system after undergoing a number of processes is able to attain its original conditions [original vol., pressure & temp^r] it is then said to have completed a cycle.

A cycle must be completed so that continuous work can be obtained otherwise the gas will escape out.

The Different operations required for the completion are HA, HR, WD (expansion) & compression. The order in which Different operation must be carried as follows:

- Heat addition
- work done (useful work)
- Heat rejection
- Compression (work input)

Ideal cycle

it is the cycle in which expansion and compression takes place adiabatically and reversibly (isentropically).

Reversible and irreversible process

When a system after undergoing a process is able to retain its original conditions along the same path in the reverse dirⁿ, the process is then said to be a reversible process.

On the other hand when the system is unable to attain its original condition while following reverse path, the process is then known as irreversible process.

2. Network Interface Cards (NIC):-

NICs are hardware components installed in computers and other devices that allow them to connect to a network. They typically include Ethernet ports for wired connections or Wi-Fi adapters for wireless connections.

3. Cables or Wireless signals:-

These are the mediums through which data is transmitted between devices. It could be Ethernet cables for wired connections or radio waves for wireless connections.

4. Routers:-

Routers are devices that forward data packets between different networks. They serve as the connection point between a local network and the internet.

5. Switches:-

Switches are devices that connect multiple devices within a local network, allowing them to communicate with each other efficiently.
